## III. Reading Comprehensions 20% @ 4%

Recent studies have shown a significant shift in how traditional industries are adapting to environmental challenges. Manufacturing companies are increasingly investing in green technologies as a response to both environmental concerns and economic pressures.

One notable example is the automotive industry's transformation. Traditional car manufacturers, which once showed resistance to change, have now committed substantial resources to electric vehicle development. Studies have shown that electric vehicles could decrease global carbon emissions by up to 20% by 2030.

This transformation poses significant challenges. Many companies must overcome technological limitations and high implementation costs. The shift requires not only substantial financial support but also extensive workforce training. Research indicates that the green technology sector could create three times more jobs than it replaces.

Moreover, while large corporations can usually absorb the costs of transition, smaller businesses often struggle. To address this issue, governments have introduced support programs, providing both financial assistance and technical guidance. Companies that have already made this transition report an average 15% reduction in operational costs.
